

ARE WE CHANGING THE UNIVERSE?

The universe is ever-changing, but human unnatural activities may alter it to an ‘unnatural way’. It is evident from the fact that with the advent of science and technology humans have changed our mother earth to a very deteriorating status which ultimately contributes to the universe. For instance, on one fine rainy day if a man is driving a car....he should collect more raindrops on the windscreen of a speeding car which otherwise would fall on the ground in a natural manner.

The raindrops collected by the speeding car’s windscreen would certainly change the property of our universe although it might be the tiniest of its kind. But this may contribute to a cumulative change in the universe with unknown consequences. Similarly, any act of humans in an unnatural way is contributing to a change in the universe which is not of its attribute. In other words the change in the world caused by human unnatural ways will undeniably disturb the Euclidean Distance Matrix feature of this universe which might change the ultimatum in the future.
